Connecting Soldiers to Digital Applications

The CSDA project has created to a systemic solution using mobile technologies from the commercial markets to fundamentally change how soldier access knowledge, training, and information in garrison, in training, and in operational environments. The project has also served as a prototype for the Agile Acquisition model being implemented to create efficiencies in the Army Acquisition process. CSDA has defined the best practices needed to give our Soldiers the advantage of emerging technologies and capabilities across the mobile communications domain. The project has and continues to identify and develop new approaches to create a persistent learning environment for the Soldier by adapting existing and emerging technologies. CSDA continues to forge a path forward to enable every Soldier access to relevant and critical knowledge, information and learning, independent of the Soldier's location or environment. Additionally, the project has developed the means to rapidly update and disseminate relevant information at a fraction of the cost of traditional methods used by the Army. In the end this project provides every Soldier with administrative, training, and tactical applications to more effectively and efficiently accomplish individual and collective tasks.
